Each soil map unit area may have more than one soil component type (comp1_, comp2_, comp3_ in the attributes) with distinct characteristics, in addition to the characteristics common to the entire map unit area. The soil survey was completed for Burns District and Harney County according to national NRCS standards at the order 2 and 3 level of detail for the Ecological Site Inventory of 1986-1991. This theme can also be linked to other databases with even more detailed soils and potential plant community data using the key fields, mapunit, or comp#_series or comp#_rangesite. Because the vegetation was tied to soil mapping, each area may more than one plant community (comp1_', comp2_', comp3_') with different characteristics. Please see ESI data dictionaries attached for explanation of the attributes. This theme can be linked to other databases for more detailed information about the plant species identified by the ESI crews. PLANTS.DBF contains data such as % foliar cover and % composition for ALL species seen in a particular "write-up". Go to tables and add this database then link on writeupno, or comp2_writeupno. 4/99
